Why measuring ?

We cannot read superposition. When we look at a qubit, it collapses to a classical bit.

Why measuring ?

We cannot read superposition. When we look at a qubit, it collapses to a classical bit.

What do we get ?

We measure 0 or 1 with a probability that depends on the state of the qubit.

Why measuring ?

We cannot read superposition. When we look at a qubit, it collapses to a classical bit.

What do we get ?

We measure 0 or 1 with a probability that depends on the state of the qubit.

- $|0\rangle \rightarrow 0$ (100%)

Why measuring ?

We cannot read superposition. When we look at a qubit, it collapses to a classical bit.

What do we get ?

We measure 0 or 1 with a probability that depends on the state of the qubit.

- $|0\rangle \rightarrow 0$ (100%)
- $|1\rangle \rightarrow 1$ (100%)

Why measuring ?

We cannot read superposition. When we look at a qubit, it collapses to a classical bit.

What do we get ?

We measure 0 or 1 with a probability that depends on the state of the qubit.

- $|0\rangle \rightarrow 0$ (100%)
- $|1\rangle \rightarrow 1$ (100%)
- $|+\rangle \rightarrow 0$ (50%), 1 (50%)

Why measuring ?

Problem Definition

Given an oracle for a function f :

$$f : \{0,1\}^n \rightarrow \{0,1\}$$

$$f(x) = x \cdot s$$

where s is a secret bit string. Find s with the fewest oracle calls. (\cdot is the bitwise dot product, XOR sum).

Classical Algorithm - Example

Example ($n=2$)

To find $s = s_0s_1$:

Requires 2 queries.

Example ($n=2$)

To find $s = s_0s_1$:

- Query $f(10)$. Result: s_0 .

Requires 2 queries.

Example ($n=2$)

To find $s = s_0s_1$:

- Query $f(10)$. Result: s_0 .
- Query $f(01)$. Result: s_1 .

Requires 2 queries.

Complexity: $\mathcal{O}(n)$

We need to isolate each bit of s by querying with inputs that have a single '1'. This requires n queries for an n -bit string.

Quantum Algorithm - Overview

Complexity: $\mathcal{O}(1)$

The quantum algorithm can find s with just **one** query. It uses superposition to query all possible inputs simultaneously.

Quantum Algorithm - Circuit

Circuit Diagram

Quantum Algorithm - Circuit

Circuit Diagram

Explanation

Quantum Algorithm - Circuit

Circuit Diagram

Explanation

- $H^{\otimes n}$: Hadamard gates on all n input qubits (creates superposition).

Quantum Algorithm - Circuit

Explanation

- $H^{\otimes n}$: Hadamard gates on all n input qubits (creates superposition).
- U_f : The quantum oracle.

Quantum Algorithm - Circuit

Circuit Diagram

Explanation

- $H^{\otimes n}$: Hadamard gates on all n input qubits (creates superposition).
- U_f : The quantum oracle.
- Final Hadamards and measurement reveal s .

Shor's Algorithm

Complexity Gain

Classical factoring is very slow (roughly $\mathcal{O}(e^{\sqrt[3]{n}})$). Shor's algorithm is much faster (polynomial, $\mathcal{O}((\log N)^3)$).

Shor's Algorithm

Complexity Gain

Classical factoring is very slow (roughly $\mathcal{O}(e^{\sqrt[3]{n}})$). Shor's algorithm is much faster (polynomial, $\mathcal{O}((\log N)^3)$).

Requirements

Shor's Algorithm

Complexity Gain

Classical factoring is very slow (roughly $\mathcal{O}(e^{\sqrt[3]{n}})$). Shor's algorithm is much faster (polynomial, $\mathcal{O}((\log N)^3)$).

Requirements

- Requires a large number of high-quality (low-error) qubits (roughly $2n$ for an n -bit number).

Shor's Algorithm

Complexity Gain

Classical factoring is very slow (roughly $\mathcal{O}(e^{\sqrt[3]{n}})$). Shor's algorithm is much faster (polynomial, $\mathcal{O}((\log N)^3)$).

Requirements

- Requires a large number of high-quality (low-error) qubits (roughly $2n$ for an n -bit number).
- We currently don't have quantum computers large and stable enough to break practical RSA encryption.

- 5 Conclusion

What is PQ cryptography

- Based on (other) mathematical problems
- Considered unsolvable by a quantum computer

What it is not :

- Cryptography **using** quantum technologies

The problems

- Codes
- Hash functions
- Multivariate polynomials systems
- Isogenies
- Lattices

The problems

- Codes
- Hash functions
- Multivariate polynomials systems
- Isogenies
- **Lattices**

Why lattices ?

- Well spread
- Good results

Encryption/Key encapsulation	
Crystals-Kyber	Lattices
Signatures	
Crystals-Dilithium	Lattices
Falcon	Lattices
Sphincs+	Hash

- 5 Conclusion

Some definitions

- A discrete subgroup of \mathbb{R}^n

Like vector spaces, we have :

- Vectors and matrices
- Linear combination

Example

FIXME : Basis:

TODO

(Fully) homomorphic encryption

- Based on lattices (variant of LWE problem)

(Fully) homomorphic encryption

- Based on lattices (variant of LWE problem)
- We can evaluate a circuit (operations) on encrypted data
- Two operations : $+$ and \cdot , forms a ring

(Fully) homomorphic encryption

- Based on lattices (variant of LWE problem)
- We can evaluate a circuit (operations) on encrypted data
- Two operations : $+$ and \cdot , forms a ring
- We can evaluate (or compile) a function $f : P \times P \rightarrow P$ on encrypted data C_1 and C_2 :

$$eval(f, C_1, C_2) = Enc(f(Dec(C_1), Dec(C_2)))$$

(Fully) homomorphic encryption

- Based on lattices (variant of LWE problem)
- We can evaluate a circuit (operations) on encrypted data
- Two operations : $+$ and \cdot , forms a ring
- We can evaluate (or compile) a function $f : P \times P \rightarrow P$ on encrypted data C_1 and C_2 :

$$eval(f, C_1, C_2) = Enc(f(Dec(C_1), Dec(C_2)))$$

- Used to manipulate private data (e.g. Medical data, data science)
